

KB 045 - Checking if the Java agent is deployed correctly

The easiest way to check to see if the agent is really running is to hit the following url:

http://<ip>:<nwa_port>/sap_powerconnect_java-1.0.0-SNAPSHOT-standalone/

It should ask for the administrator credentials then will return a version message:

If there is a 404 not found or some sort of error instead then it means the agent has not been fully deployed.
